

A statistical approach of the chromaticity. The sticheron *Σήμερον συνέχει τάφος – Today,* *a tomb holds Him* in the new and old notation

DIMOSTHENIS SPANOUDAKIS

Η περαιτέρω ανάπτυξη μεθόδων ανάλυσης της Βυζαντινής Μουσικής μέσω διακαλλιτεχνικών και διεπιστημονικών ανοιγμάτων, ειδικά με την αξιοποίηση πορισμάτων έρευνας στους τομείς των γνωσιακών επιστημών της μουσικής, μπορεί να φέρει στο φως πολλές άγνωστες ακόμα πτυχές αυτής της θαυμάσιας μουσικής.¹

1. Introduction

The present study proposes an interdisciplinary approach (Musicology and Mathematics – Statistic) which has to do with the analysis to the Byzantine Music through the research in manuscripts with new and old notation².

More specifically, we use a mathematically-statistically³ informed approach to investigate chromaticity in the *sticheron Σήμερον συνέχει*

¹ A further development of analytical methods of Byzantine Music through interarts and interdisciplinary approaches, especially through the use of research findings in the fields of cognitive science of music will enlighten many unknown aspects of this wonderful music; Μαρία Αλεξάνδρου, “Παρατηρήσεις για την ανάλυση, υφή και μεταισθητική της Βυζαντινής Μουσικής. Ο ύμνος Σιγησάτω πάσα σαρξ βροτεία” (Maria Alexandru, “Remarks on the analysis, musical texture and meta-aesthetics of Byzantine Chant. The Hymn *Let all mortal flesh keep silence*”), in International Musicological Conference “Crossroads | Greece as an intercultural pole of musical thought and creativity”, School of Music Studies of the Aristotle University of Thessaloniki and International Musicological Society (IMS), Regional Association for the Study of Music on the Balkans, 6-10 of June 2011, Θεσσαλονίκη, at the conclusions of this article – unit 4. Proceedings to be published; I would like to thank Professor Alexandru for her support and encouragement.

² By new notation we mean the so called New Method or New System in use since 1814, the year of the Reform of the Three Teachers. Old notation is every kind of notation before 1814, in our case especially the middle-Byzantine one. Cf. Μαρία Αλεξάνδρου, *Iστορία της Βυζαντινής και Μεταβυζαντινής Μουσικής* (Maria Alexandru, *History of Byzantine and post-Byzantine music*), vol. 2, Αριστοτέλειο Πανεπιστήμιο Θεσσαλονίκης, Τμήμα Μουσικών Σπουδών, 2007-2008, pp. 7-8.

³ “Statistics is the science of learning from data, and of measuring, controlling, and communicating uncertainty; and it thereby provides the navigation essential for controlling the course of scientific and societal advances.” From the American

τάφος – *Today, a tomb holds Him*⁴ which is chanted as the first idiomelon of the Lauds of Mattins of Holy Saturday and it is in the second (B') mode with finalis *Di5*.

In the present study, the sticheron which belongs to the repertory of the *Old Sticherarion*, is examined:

i) In new notation from the manuscript *Sancti Sepulcri 715* (MPT 715⁶), which is written by Chourmouzios Chartofylax in the early 19th century⁷ and includes the slow exegeseis – transcriptions – interpretations of the aforementioned Teacher for the old sticheraric style.

ii) In old notation from the highly important manuscript Dionysiou 564 (D 564), which is written by Grigorios Mpunis Alyatis⁸ in

Statistical Association webpage: <http://www.amstat.org/careers/whatisstatistics.cfm> (11/05/2012).

⁸ Alyatis was possibly the Precentor of St. Sophia in Constantinople in 1453, the year of the Fall of the City. For a detailed ergobiography: Maria Alexandru, "Gregorios Mpunis Alyatis: An Open Bioergographic Index Card and an analysis of the pentikostarion Τὴν

1445 A.D. This manuscript is neumated with fully developed Middle-Byzantine notation.⁹

The aim of the study is to investigate whether some notes of the chromatic scale have a “closer relation” with:

- i) the ison and the neumes which augment the duration of the phonetic signs¹⁰,
- ii) the syllables and the kola¹¹ of the hymnographic text.

λάμψιν τοῦ προσώπου σου”, in *Psaltike, Neue Studien zur Byzantinischen Musik: Festschrift für Gerda Wolfram*, ed. Nina Maria Wanek, Praesens, Vienna, 2011, p. 18. Στάθης, Αθήνα, 2003, p. 270.

About a detailed description and the dating of the manuscript: Γρηγόριος Στάθης, *Tὰ χειρόγραφα βυζαντινῆς μουσικῆς, Ἅγιον Ὄρος, Κατάλογος περιγραφικός* (Gregorios Stathis, *The manuscripts of byzantine chant, Holy Mountain, Descriptive catalogue*), vol. 2, Ίδρυμα Βυζαντινῆς Μουσικολογίας and Γρηγόριος Στάθης, Αθήνα, 1976, pp. 688-689.

⁹ For the stages and the development of the old notation see: Αλεξάνδρου, *Ιστορία*, pp. 7-8.

¹⁰ In the new notation these signs are the so called *prosthetika chronika simeia* (additive duration marks): the *klasma*, the *apli* with its derivates (*dipli* [double], *tripli* [triple] e.t.c.) and the *argon*. All signs add duration to the note on which they have been put. Παναγιωτόπουλος, *Θεωρία*, pp. 66-67 and 78. The pauses in the new notation could be considered as *prosthetika chronika simeia* but they will not be included in our measurements because they are not related with any note. In the old notation the duration marks are called *argiai* and they are four: *kratima*, *dipli*, *dyo apostrophoi*, and *tsakisma*. However, in this paper we will not examine the *tsakisma* because it represents only the half length (*ἡμιουραργία*) according to the Protheory of the Papadike. Cf. Maria Alexandru, *Studie über die 'grossen Zeichen' der byzantinischen musikalischen Notation unter besonderer Berücksichtigung der Periode vom Ende des 12. bis Anfang des 19. Jahrhunderts*, Dissertation, vol. 2, University of Copenhagen, 2000, p. 17. Moreover it seems that *tsakisma*'s functionality has to do both with the embellishment and only a small increasing of the duration of the note on which it stands.

¹¹ The *kolon* could be defined as the basic musical and poetical unit of a setting. It ends with a cadence. Cf. Maria Alexandru, “Αναλυτικές προσεγγίσεις και ιχνηλασία του κάλλους στη βυζαντινή μουσική. Ο Ευχαριστήριος ‘Υμνος Σὲ ὑμνοῦμεν’”, (Maria Alexandru, “Analytic approach and a quest for the discovery of beauty of byzantine music. The Thanksgiving Hymn, *We pray You*), in *Symposium Μουσική Θεωρία και ανάλυση – Μεθοδολογία και Πράξη* (Music Theory and analysis – Methodology and Practice), Proceedings of the Symposium, 29.09.-1.10. 2006, ed. Kostas Tsougras and A.U.Th. - School of Music Studies, Θέρμη - Θεσσαλονίκη, 2006, p. 320. See also Ομάδα Παλαιογραφίας Βυζαντινῆς Μουσικῆς από το Τμήμα Μουσικών Σπουδών του Αριστοτελείου Πανεπιστημίου Θεσσαλονίκης, “Χρυσέοις ἐπεσι, ἑνα στιχηρό εις τιμὴ του Αγίου Ιωάννου του Χρυσοστόμου στη διαχρονικὴ του εξέλιξη: Παλαιογραφικές & αναλυτικές αναζητήσεις” (Study Group of Palaeography of Byzantine Music, “*Chryseois epesi-In golden words*” – a *sticheron* in honor of St. John Chrysostom in its diachronic musical development), ed. M. Alexandru, in *Proceedings of the 1st*

Moreover, we want to examine whether and how some notes have a greater total duration in comparison with other notes in the same scale and to visualize the “profile¹²” of the second mode according to the acoustic result of the sticheron *Σήμερον συνέχει τάφος*.

The conclusions emerge through a parallel research which focuses on the modulations which occur in the sticheron both in new and old notation. It has to be noticed that the notes in the old notation show us the metrophonic structure of the melody¹³.

2. The sticheron Σήμερον συνέχει τάφος in new notation. The interpretation of Chourmouzios Chartofylax in MPT 715

In new notation we examined statistically:

- ❖ In which note and how often we have the *ison* and the additive duration marks¹⁴.
- ❖ Which are the first notes of every *kolon* and inside the *kolon*, of every new syllable of the hymnographic text.
- ❖ Which is the total duration of each note in the whole *sticheron*.
- ❖ Which is the “profile” of the ‘B’ mode according to the distribution of the duration of the tones of the chant we examine.

The reason we include the *ison* and the additive duration marks in our measurements, is that the first sign causes repetition while the second group of signs causes extension of the note, in other words, both signs lead to melodic strengthening of the respective notes. Similarly, we

International Conference of the American Society of Byzantine Music and Hymnology, September 10-15th 2007, Αθήνα, p. 357 (337-485). Published on the internet: <http://www.asbmh.pitt.edu/page9/page10/page11/page11.html> and <http://www.asbmh.pitt.edu/page12/Alexandru.pdf>

At the beginning of this study the plan included only the measurements for the first note for every syllable. After the suggestion of Professor Alexandru the first note of the *kolon* has also been taken in consideration.

¹² This was the second suggestion of Professor Alexandru.

¹³ Metrophonic structure of a piece is what is written down with the intervals signs (*ison* and *emphona*) of the middle-Byzantine. Μαρία Αλεξάνδρου, *Παλαιογραφία Βυζαντινής Μουσικής* (Maria Alexandru, *Palaeography of Byzantine Music*), Αριστοτελείο Πανεπιστήμιο Θεσσαλονίκης, notes of the courses entitled: Μετροφωνία – Παραλλαγή – Μέλος και ἄλλες ἐννοιες κλειδί στη Θεωρία της Ψαλτικής Τέχνης (*Metrophonia – Parallagi – Melos* and other key terms in the Theory of the Chanting Art), academic year 2012-2013. The notes we read in metrophonic structure (old notation) are called notes of the metrophonic structure or structural notes. On the other hand, dominating notes (new notation) are the notes, on which the cadences (perfect, imperfect, final) of the *melos* occur. Additionally, these notes appear more frequently and the melody focuses on them, while neighbour notes usually tend to be attracted by them. See: Παναγιωτόπουλος, *Θεωρία*, pp. 126-127.

¹⁴ The so called *prosthetika chronika simeia* (*klasma*, *apli* and *argon*). See footnote 16 in the introduction.

examine the first note of every new syllable and the *kolon*. The relation between words and music in Byzantine Chant is very strong¹⁵ and additionally, it seems that the first note of each syllable and the incipit of each *kolon* are of major importance in the perception's and memory's area¹⁶. Furthermore, we examine the total duration for each note in order to: a) find out which notes sound longer in this *sticheron* and b) shape the “profile” of the second mode with finalis Di.

In Fig. 1 is the *sticheron* from manuscript MPT 715¹⁷. The additional colored circles show the *phthorai* which indicate modulation. Blue circles show the *phthorai* for the soft chromatic scale, red circles the *phthorai* for the intense chromatic scale and green circles the *phthorai* for the soft diatonic scale. Table 1 includes the hymnographic text with structural, metrical and modal analysis¹⁸ of the *sticheron*. In the first, second and third column the periods, verses and *kola* are noticed respectively. In the fourth column the full hymnographic text is colored in order to show the use of the soft chromatic scale with blue color, the intense chromatic scale with red color and the diatonic scale with green color. Sometimes, a change of scale occurs inside a syllable. In such cases the syllable is underlined. The color of the letters shows the scale at the beginning of the syllable and the color of the line shows the following scale. There is no syllable with more than one modulation in this *sticheron*. At the last column there is the total number of syllables for each *kolon*.

In Table 2 we have the statistic measurements we aforementioned and in Graphs 1a till 6 we have the visualization of these measurements. It is necessary to notice some parameters of the measurements. When the intense chromatic scale or the diatonic scale is used, then the

¹⁶ Sven Blankenberger & Katrin Bittrich, “The Impact of Trace Decay, Interference, and Confusion in a Tonal Memory Span Task”, in *12th International Conference for Music Perception and Cognition and 8th Conference of the European Society for the Cognitive Sciences of Music. Proceedings of the joint Conference*, 23-28.07.2012, ed. Emilios Cambouropoulos, Costas Tsougras, Panayotis Mavromatis, Konstantinos Pastiadis, A.U.Th. – School of Music Studies, Θεσσαλονίκη, 2012, p. 109 and hand out of the presentation. In the proceedings only the abstract of this paper is included exclusively in p.109. In this research, the impact of different mechanisms of forgetting in short term memory for tonal and verbal stimuli is examined. In the main results, included in the hand out, it was mentioned that the first verbal and tonal stimuli had the greatest percentage of correct immediate and delayed recall.

¹⁷ For this manuscript see the unit 1. Introduction.

¹⁸ This multilevel analysis is based on the researches of the Study group of Palaeography from Aristotle University of Thessaloniki.: Ομάδα Παλαιογραφίας, "Χρυσόεις ἐπεστί".

measurements are based on the notes of the *pseudoparallagi*¹⁹. Moreover, the effect of the *phthorai* is measured from the sign on which they stand. For instance, almost at the beginning of the second line of the *sticheron*, on the syllable *συν-* of the word *συνέχει*, there is a *phthora* for the intense chromatic scale (see Fig. 1). This *ison* is counted in the intense chromatic scale.

Furthermore, in two cases there are two *isa* with *gorgon*²⁰. The duration of each *ison* pair lasts one *protos chronos* (one quaver in a hypothetical transcription on staff) and for this reason each pair is counted as one *ison*.

¹⁹ By *Pseudoparallagi* we mean the change of the names of the notes according to a *phthora* which indicates a modulation in another mode or/and scale.

²⁰ 1) Seventh line of the *sticheron* on the syllable *-θος* of the word *λιθος*. 2) Fifteenth line on the syllable *-ξα* of the word *δόξα*.

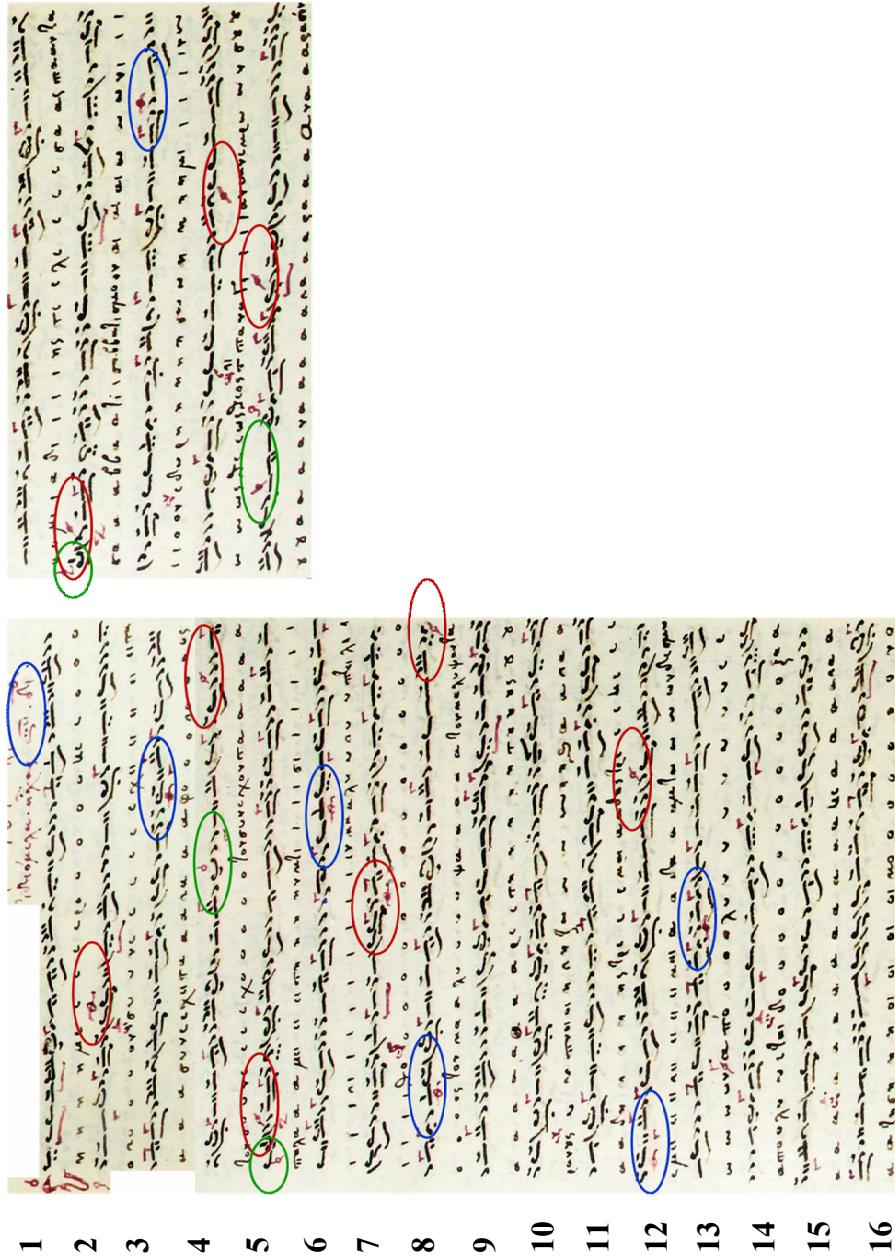

Figure 1. The sticheron $\Sigma\eta\mu\epsilon\rho\nu\sigma\nu\varepsilon\xi\tau\rho\sigma$ in manuscript MPT 715 (f. 193v-r). Blue circles show the phthorai for the soft chromatic scale, red circles the phthorai for the intense chromatic scale and green circles the phthorai for the diatonic scale.

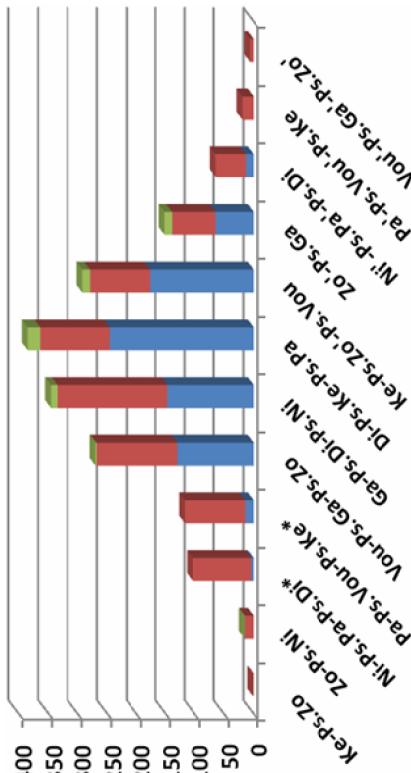

Graph 5b. The overall duration of each note (*pseudoparallagi*) in the parts where the intense chromatic scale is used, and their overall duration (vertical axis) in manuscript MPT 715, f. 193r-v.

Graph 5c. The overall duration of each note (*pseudoparallagi*) in the parts where the diatonic scale is used.

Graphs 5a-c. The notes (horizontal axis) and their overall duration (vertical axis) in the *sticheron Σήμερον συνέχει τάρος* in manuscript MPT 715, f. 193r-v.

Graph 6. The “profile” (distribution of the duration of the tones) of the second mode with finalis Di in the *sticheron* Σημεπον αντέχει τάφος in manuscript MPT 715, f. 193r-v. The inner modal oscillations in B', pl.B' mode and diatonic scale of the *sticheron* are included. Duration is counted in quavers i.e. half *chronoi protoi*.

2.2. Observing the measurements' results and the graphs

1a till 6

Observing the Graphs 1a-c for the *ison*, we can see that when the melody uses the soft chromatic scale, the notes with *ison* are more usually the notes Vou, Di and Ke (overall percentage of the dominating notes²² of the B' mode Vou and Di²³: 55,5%). On the other hand, when the melody uses the intense chromatic scale, the notes are more usually Pa and Di (overall percentage of the dominating notes of the plagal of the second mode [pl.B'] Pa and Di²⁴: 53,7%). It should be noticed that in this *sticheron* there is no *ison* on note Pa in the soft chromatic scale, while there is no *ison* on note Vou of the *pseudoparallagi* in the intense chromatic scale. There are also small parts of short duration where the diatonic scale is used. For this reason we will not examine them in this paper. A future study will focus on the diatonic genre with more than two *stichera*.

Graphs 2a-c and Table 2 show us similar things with Graphs 1a-1c. Dominating notes are strengthened with additive duration marks more than the other notes. Vou and Di for the soft chromatic scale have an overall percentage: 63,8%. Pa and Di (*pseudoparallagi*) in the intense chromatic scale have an overall percentage: 41,3%, bigger than any other pair of notes.

In Graphs 3a-c and Table 2 we see a very strong relation between the dominating notes and the first note of the syllables of the hymnographic text. Specifically, the first note for each new syllable is more usually in the soft chromatic scale one of the dominating notes Vou or Di (overall percentage 72,3%), while in the intense chromatic scale syllables begin with the dominating notes Pa and Di (*pseudoparallagi*) in overall percentage 56,9%.

In Graphs 4a-c and Table 2 a difference between soft and intense chromatic scale is obvious. In the soft chromatic scale new *kola* begin exclusively with the dominating notes Vou and Di (percentage 100%) while in the intense chromatic scale new *kola* begin equally with notes of the *pseudoparallagi* Ni, Pa, Vou, Ga, Di (Pa and Di 40,0%).

Graphs 5a-c are differentiated from the previous graphs. While both in the soft and intense chromatic scale the note Di²⁵ has the biggest

²² Dominating notes are the notes, on which the cadences (perfect, imperfect, final) of the *melos* occur. Additionally, these notes appear more frequently and the melody focuses on them, while neighbour notes usually tend to be attracted by them. See: Παναγιωτόπουλος, Θεωρία, pp. 126-127.

²³ Θεωρητικὸν μέγα τῆς μουσικῆς Χρυσάνθου τοῦ ἐκ Μαδύτων (*Great Theoritikon of Music by Chrysanthos ek Madyton*), critical edition by Γεώργιος Κωνσταντίνου, Ιερά Μεγίστη Μονή Βατοπαιδίου, 2007, pp. 412-413.

²⁴ Θεωρητικὸν μέγα, pp. 420-421.

²⁵ For the intense chromatic scale: Di of the *pseudoparallagi*.

overall duration, notes You and Pa respectively are the fourth notes in overall duration. In the soft chromatic scale the second and the third note are Ke and Ga (Di 14,0%, Ke 10,4%, Ga 8,4% and You 7,0%). In the intense chromatic scale the second and the third note of the *pseudoparallagi* are Ga and You, followed by Pa on the fourth place (Di 10,8%, Ga 9,1%, You 7,7% and Pa 7,4%).

In Graph 6 we have the “profile” of the second mode for this *sticherion*. It seems that there is an axis of symmetry in this Graph formed by the notes Di-19,5% and Ga-21,8% (Ke and Di / Pa and Ni of the *pseudoparallagi* in the pl.B’ respectively). The notes higher than Di (Ke-16,5% and Zo’-8,6%) have a reduced overall duration in a similar way with the notes lower than Ga (You-15,3% and Pa-6,6%).

Concerning the above, we conclude that dominating notes of each mode-scale are melurgically strengthened with *ison* and additive duration marks (*prosthetika chronika simeia*) and are directly connected with the beginning of the microstructural (syllable) and mesostructural²⁶ (*kola*) parts of the musical-poetical text. However, as we see in Graphs 5a-c, they don’t have always the greatest overall duration. In short, dominating notes are strengthened qualitatively but not always quantitatively.

In this point we have to notice that we have already examined the *sticherion* in the new notation where almost every sign indicates a specific note and the B’ mode and the pl.B’ mode have a different scale with different intervals. In the old notation these two parameters were significantly differentiated. Firstly, in the old notation, the scale for the B’ and the pl.B’ mode is the same²⁷ and secondly, the old notation is treated as stenographical by the Three Teachers, thus being subjected to slow *exegesis*. This means that every sign indicates one or more than two notes or a whole musical phrase according to the musical context²⁸. Thus, an important question arises: Which will be the results of the measurements if we examine the same *sticherion* in the middle-Byzantine notation?

²⁶ For the categorization of the musical poetical text in microstructural, mesostructural and macrostructural level see: Σωτήρης Δεσπότης, *Έρμηνευτικές προσεγγίσεις στό μουσικό ύλικό της ελληνικής ψαλτικής τέχνης* (Sotirios Despotis, *Approaches to the interpretation of the music material of the Greek Chanting Art*), in Γρηγόριος ο Παλαμάς (pp. 417-428), y. 90, fasc. 818, Θεσσαλονίκη, 2007, p. 421.

²⁷ See Fig. 2.

E. Cambouropoulos, R. Parncutt, M. Solomos, D. Stefanou, C. Tsougras, A.U.Th. – School of Music Studies, Thessaloniki, 3-6 July 2008, p. 1.

3. The *sticheron Σήμερον συνέχει τάφος* in middle-Byzantine notation from the manuscript Dionysiou 564

Now we will examine the *sticheron Σήμερον συνέχει τάφος* in the old notation from the manuscript Dionysiou 564 (D 564) which is written by Gregorios Mpunis Alyatis in the year 1445²⁹. As it is mentioned at the beginning of this paper, the highly important manuscript is neumated with fully developed Middle-byzantine notation. In Fig. 3 we see the *sticheron* with additional transnotation according to former researches³⁰. As it is expected, there are no *phthorai* in the old manuscript despite the fact that in the interpretation by Chourmouzios we see eighteen *phthorai* for soft and intense chromatic and diatonic scale. Thus, an additional important question arises: Why did Chourmouzios Chartofylax made the modulations that we see in MPT 715? An obvious answer is that Chourmouzios knew the modulations from the oral tradition. However in this paper, we examine whether, except of the oral tradition, there are some embodied and hidden elements in the old notation which could reveal to us these modulations or generally some properties of the second mode and the chromatic genre.

We make the same measurements according to the modulations or rather modal oscillations in the interpretation by Chourmouzios Chartofylax. See Fig. 1 with the interpretation and the *phthorai* in MPT 715, Fig. 3 with the transnotation in D 564 according to the modulations in Chourmouzios' *exegesis* and Table 1 with the analysis in the hymnographic text. In Fig. 3 the letters of the transnotation indicate the modulations in the *exegesis*. Thus, the blue letters indicate soft chromatic scale in the interpretation, while red and green letters indicate intense chromatic and diatonic scale respectively. There are some syllables with two scales in their melody, for instance the syllable -θος of the word λιθος³¹ with soft and intense chromatic scale. In such cases the color of the transnotation letter in Fig. 3 refers to the first scale. It is also important to be noticed that the transnotation letters for each syllable are without space. Moreover, the illegible place from this folio of D 564

²⁹ For detailed information of the manuscript see unit 1. Introduction.

Colors indicate the modal oscillations in Chourmouzios' *exegesis*. See also Fig. 2 for old and new theoretical scale of B' and pl.B' mode.

3.2. Observing the measurements and the Graphs 7(a-c) till 12(a-c)

In Fig. 3, Table 3 and Graphs 7a-7d we see that the *ison* in the blue notes of the metrophonic structure³⁶ (soft chromatic scale) occurs only on G# and b / You and Di. More specifically, ten of the twelve *isa* are on the structural note G# / You. On the other hand, in the red Graph 7b we see that *isa* are on the structural notes E, a and c / Ni, Ga and Ke. This is important because the structural notes E and a, define a tetrachord which indicates the tetrachord Pa-Di in the New Method. Thus, the structural notes E, a and c / Ni, Ga and Ke correspond to Pa-Di-Zob. We will not comment the graphs for the diatonic parts due to their small percentage in this *sticheron*.

Graphs 8-8(a-c), 9-9(a-c), 10-10(a-c), 11-11(a-c) and 12-12(a-c) have a similar form with Graphs 7-7(a-c). Structural notes G# and b / You and Di in parts which have been interpreted in the soft chromatic scale are connected with the *dipli*, *dyo apostrophoi*, *kratima* and the beginning of the new syllables and *kola*. Respectively, in Graphs 8b, 9b, 11b and 12b, structural notes E and a / Ni and Ga are more than any other note connected with these measurements' objects.

4. Conclusions

❖ According to the measurements of this study in the *sticheron Σήμερον συνέχει τάρος*, some conclusions for the chromaticity and the dominating notes in the old sticheraric genre arise.

❖ In the new notation dominating notes are melurgically-compositionally strengthened with the usual repetition via *ison* (Graphs 1-1[a-c]) and with the usual extension of their duration through additive duration marks (Graphs 2-2[a-c]).

❖ Dominating notes ($\Delta\epsilon\sigma\pi\circ\zeta\circ\tau\epsilon\varsigma \varphi\theta\circ\gamma\gamma\circ\iota$) have a direct relation with the microstructural (syllables) and mesostructural (*kola*) verbal units of the hymnographic text, since they usually function as their first note.

❖ Dominating notes are differentiated as far as their overall duration is concerned. One of the two dominating notes has the greatest overall duration (Di in the B' and Ps.Di in pl.B' mode), while the other

³⁶ As we mentioned in 1. Introduction. Notes of the metrophonic structure or structural notes are the notes we read in metrophonic structure (old notation). However, dominating notes (in the new notation) are the notes, on which the cadences (perfect, imperfect, final) of the *melos* occur. Additionally, these notes appear more frequently and the melody focuses on them, while neighbour notes usually tend to be attracted by them. See: Παναγιωτόπουλος, *Θεωρία*, pp. 126-127.

dominating notes have the fourth overall duration (Vou in the B' and Ps.Pa in pl.B' mode).

❖ To sum up the above, dominating notes are strengthened qualitatively but not necessarily quantitatively.

In new and old notation,

❖ The parts of the *exegesis* where Chourmouzios uses the soft chromatic scale correspond to the parts of the D 564 where the metrophonic structure focuses on notes G# and b / Vou and Di; In the same way, the parts of the interpretation where Chourmouzios uses the intense chromatic scale correspond to the parts of the D 564 where the metrophonic structure focusses on notes E and a / Ni and Ga. This means that in the second mode the metrophonic structure indicates the modal oscillations we see in the slow *exegesis*.

❖ It is about an indirect way of suggesting-showing the modulations since those are not explicitly noted (with *phthorai*) in the musical manuscript. These modulations or better modal oscillations will be easily noticed-recognized by an expert in old notation and oral tradition like the Three Teachers.

❖ It seems that there was no need for *phthorai* in middle-Byzantine notation in such cases. The notes of the metrophonic structure had greater «melurgical-compositional importance» than in new notation and sometimes, under specific circumstances, an individual note, which was strengthened for example with one or two contiguous *isa*, indicated a modulation in another mode³⁷. With the passing of centuries the old notation becomes more and more *exegetical-analytical*. Thus, the same «melurgical-compositional idea» is shared-described in more notes than before and the «melurgical-compositional importance» of each note is decreased. This made more difficult for the musician to estimate-recognize the importance of the metrophonic structure notes which could lead to modulation. A need for an easier and direct sign for modulation arose, the *phtora*.

❖ The same measurements have been already done for other signs (e.g. *tsakisma*, *bareia* e.t.c.) and possibly will be presented in the future. It seems that such a palaeographical and statistical approach can reveal elements for the functionality of these signs in the old notation.

³⁷ Such a case can be observed on the words ως Θεός in D 564 (end of the eighth line), in comparison with the interpretation in MPT 715.

**A statistical approach of the chromaticity.
The sticheron *Σήμερον συνέχει τάφος – Today, a tomb
holds Him* in the new and old notation**

ABSTRACT

The present study proposes an interdisciplinary approach (Musicology and Mathematics – Statistic) which has to do with the analysis to the Byzantine Music through the research in manuscripts with new and old notation. More specifically, we use a mathematically-statistically informed approach to investigate chromaticity in the *sticheron Σήμερον συνέχει τάφος – Today, a tomb holds Him* which is chanted as the first idiomelon of the Lauds of Mattins of Holy Saturday and it is in the second (B') mode with finalis *Di*.

According to the measurements of this study in the *sticheron Σήμερον συνέχει τάφος*, some conclusions for the chromaticity and the dominating notes in the old sticheraric genre arise; In the new notation dominating notes are melurgically-compositionally strengthened with the usual repetition via *ison* (Graphs 1-1[a-c]) and with the usual extension of their duration through additive duration marks (Graphs 2-2[a-c]); Dominating notes ($\Delta\sigma\pi\delta\zeta\omega\tau\epsilon\varsigma\varphi\theta\gamma\gamma\omega\iota$) have a direct relation with the microstructural (syllables) and mesostructural (*kola*) verbal units of the hymnographic text, since they usually function as their first note.

In new and old notation, the parts of the *exegesis* where Chourmouzios uses the soft chromatic scale correspond to the parts of the D 564 where the metrophonic structure focuses on notes G# and b / *Vou* and *Di*. In the same way, the parts of the interpretation where Chourmouzios uses the intense chromatic scale correspond to the parts of the D 564 where the metrophonic structure focuses on notes E and a / *Ni* and *Ga*. This means that in the second mode the metrophonic structure indicates the modal oscillations we see in the slow *exegesis*; It is about an indirect way of suggesting-showing the modulations since those are not explicitly noted (with *phthorai*) in the musical manuscript. These modulations or better modal oscillations will be easily noticed-recognized by an expert in old notation and oral tradition like the Three Teachers.
